Table 1: **Revision History**

Date	Version	Notes
March 15, 2022	1.0	Initial Document
March 16, 2022	1.1	Added initial drafts of Module Hierarchy and Module Decomposition Sections
March 17, 2022	1.2	Added initial draft of Anticipated and Unlikely Changes Section; added uses hierarchy diagram to Use Hierarchy Between Modules Section; added traceability matrices to Traceability Matrix Section
March 17, 2022	1.3	Added and modified Intro and Connection sections.
April 11/12, 2022	2.0	Updated Module Guide documentation for Revision 1 submission

1 Introduction

The Random Flag Generator **(RFG)** is an implementation based on ~~of~~ the open-source project **PAGAN**, (Python Avatar Generation for Absolute Nerds). The main functionality of the program comes from generating a hash digest ~~hashcode~~ from a user's input string and creating a unique graphical output based on the generated hash digest ~~hashcode~~. The **RFG** ~~Flag Generator~~ generates a unique flag with its own set of colours, symbols, designs, etc. The user can set the flag to be generated entirely based on the hash digest generated from the user's input string, or choose to set certain elements of the flag (i.e. choose certain colours or symbols to be included on the generated flag).

1.1 Purpose

The purpose of the Module Guide document is to outline how this system is modularly decomposed. Following a module decomposition approach, the information hiding principle is being adhered to (Parnas, 1972). Following this principle also allows new project members, maintainers, and designers to be able to easily identify the individual components of the software, derive an understanding of the hierarchical structure of the system, and to easily verify certain software criteria such as consistency, flexibility, and feasibility. Additionally, by breaking up the system into modules, the principles of low cohesion and high coupling.

1.2 Scope

The modules used to develop this program were based off of the requirements outlined in the Software Requirements Specification. The modules' external behaviours are explicitly described and outlined in the corresponding Module Interface Specification document. Through adhering to the principle of information hiding, anticipated and unlikely changes are represented by the secrets of the modules, allowing for easier changes to be made in the future (design for change). Lastly, a uses hierarchy is established to graphically show the relationships between the modules.

1.3 Acronyms, Abbreviations, and Symbols

Table 2: **Table of Abbreviations**

Abbreviation	**Definition**
FR	Functional Requirement
GUI	Graphical User Interface
PAGAN	**Python Avatar Generator for Absolute Nerds**
RFG	**Random Flag Generator**
RGB	Red Green Blue
SRS	Software Requirements Specification
UI	User Interface

Table 3: **Table of Definitions**

Term	**Definition**
Gallery	Collection of previously generated flags.
Graphical User Interface	A form of UI that allows users to use electronic devices using interactive graphics.
Hashing	Algorithm that converts input data to a fixed-size value. A hashing function usually outputs a string or hexadecimal value.
Input String	The input of type string from the user.
Pytest	Python testing tool that allows testers to write test code and create simple and scalable test cases.
Python	The programming language used in this project.
Software Requirements Specification	A document that details what the program/software will do and how it will accomplish the expected performance/tasks.
System/Program	Collection of instructions or components that tell a computer how to operate.
Tester	An individual testing the software via the user interface or the code/test cases.
Typeform	Website that is a software as a service that specializes in creating and building online surveys.
User	Person who uses or operates a computer program.
User Interface	Where interactions between machines and humans occur.

1.4 Overview

The rest of the document is organized as follows.

- Section 2: Lists the anticipated and unlikely changes of the software requirements.
- Section 3: Summarizes the module decomposition that was constructed according to the likely changes.
- Section 4: Specifies the connections between the software requirements and the modules.
- Section 5: Gives a detailed description of the modules.
- Section 6: Includes two traceability matrices. One checks the completeness of the design against the requirements provided in the SRS. The other shows the relation between anticipated changes and the modules.
- Section 7: Describes the use relation between modules.

2 Anticipated and Unlikely Changes

This section lists possible changes to the system. According to the likeliness of the change, the possible changes are classified into two categories. Anticipated changes are listed in Section 2.1, and unlikely changes are listed in Section 2.2.

2.1 Anticipated Changes

Anticipated changes are the source of the information that is to be hidden inside the modules. Ideally, changing one of the anticipated changes will only require changing the one module that hides the associated decision. The approach adapted here is called design for change.

AC1: The addition of new flag assets.

AC2: The flag resolution options.

AC3: Available hashing functions.

AC4: Maximum size of flag gallery(number of images).

AC5: Where and how flags are displayed after being generated.

AC6: More user control over user input streams; output.

AC7: Output file format.

AC8: Input string criteria, wider range of allowable characters (broader input range).

AC9: Making changes to how to use the program.

2.2 Unlikely Changes

The module design should be as general as possible. However, a general system is more complex. Sometimes this complexity is not necessary. Fixing some design decisions at the system architecture stage can simplify the software design. If these decision should later need to be changed, then many parts of the design will potentially need to be modified. Hence, it is not intended that these decisions will be changed.

UC1: The same graphics library (PIL/pillow) will be used to generate the flag image files.

UC2: The same asset reader (JKAReader) will be used to read the flag symbol design.

UC3: String input will be used to generate the hash digests.

UC4: Input/output devices (input: keyboard, output: monitor and file).

UC5: The same hashing library (hashlib) will be used to get the hashing functions.

3 Module Hierarchy

This section provides an overview of the module design. Modules are summarized in a hierarchy decomposed by secrets in Table 4. The modules listed below, which are leaves in the hierarchy tree, are the modules that will actually be implemented.

M1: HashGenerator Module

M2: FlagAssetsLib Module

M3: JKAReader Module

M4: DecisionUtilities Module

M5: HashToFlag Module

M6: FlagGenerator Module

M7: GUI Module

M8: Display Module

M9: Gallery Module

M10: Help ~~HelpInstructions~~ Module

M11: Settings Module

Level 1	Level 2
Hardware-Hiding Module	
Behaviour-Hiding Module	HashGenerator FlagAssetsLib JKAReader GUI Display Gallery Help ~~HelpInstructions~~ Settings
Software Decision Module	DecisionUtilities HashToFlag FlagGenerator

Table 4: Module Hierarchy

4 Connection Between Requirements and Design

The design of the system is intended to satisfy the requirements developed in the **SRS**. In this stage, the system is decomposed into modules. The connection between requirements and modules is listed in Table 5, in the form of a traceability matrix.

Every **functional requirement** is implemented by at least one module, and similarly the modules responsible for handling the anticipated changes are also laid out in a traceability matrix, Table 6.

Modules are generally broken up into hash digest generation, hash code ~~hashcode~~ to flag decisions and **GUI** modules. Within these categories, there is a breakdown of modules to handle specific functionalities. The **GUI** functionality is broken down into the Display, Gallery, Help, and Settings modules to handle specific **functional requirements**. Similarly, HashToFlag's functionality is broken down into the ~~a~~ FlagAssetsLib module, the HashGenerator module (responsible for generating the hash digest ~~hashcode~~), and the ~~a~~ DecisionUtilities module (with helper functions for converting a hash digest ~~hashcode~~ to decisions). Lastly, the JKAReader module (responsible for converting .jka files into pixels) combined with the HashToFlag module comprises the majority of the FlagGenerator functionality.

5 Module Decomposition

Modules are decomposed according to the principle of "information hiding" proposed by Parnas et al. (1984). The *Secrets* field in a module decomposition is a brief statement of the design decision hidden by the module. The *Services* field specifies *what* the module will do without documenting *how* to do it. For each module, a suggestion for the implementing

software is given under the *Implemented By* title. If the entry is *OS*, this means that the module is provided by the operating system or by standard programming language libraries.

5.1 Hardware Hiding Modules

N/A

5.2 Behaviour-Hiding Module

5.2.1 HashGenerator Module (M1)

Secrets: Hashing algorithms available and method for generating hash digests from input strings and selected hashing algorithm (if available)

Services: Generates hash digests from input strings using selected hashing algorithms (if available; default algorithm is SHA-256)

Implemented By: Random Flag Generator

5.2.2 FlagAssetsLib Module (M2)

Secrets: Flag assets, constants and values used to generate flags

Services: Provides the data files and values needed to generate flags

Implemented By: Random Flag Generator

5.2.3 JKAReader Module (M3)

Secrets: Method for parsing flag asset (.jka) file data into usable form for generating flags

Services: Parses flag asset (.jka) file data into pixel maps to be used to generate flags

Implemented By: Random Flag Generator

5.2.4 GUI Module (M7)

Secrets: Methods for starting the program and presenting the **GUI** view, taking in user input strings and selected settings for generating flags

Services: Starts the program and presents the **GUI** view, takes in user input strings and selected settings for generating flags

Implemented By: Random Flag Generator

5.2.5 Display Module (M8)

Secrets: Methods for displaying the associated generated flags

Services: Displays the associated generated flags via a **GUI**

Implemented By: Random Flag Generator

5.2.6 Gallery Module (M9)

Secrets: Saved flags in user's flag **gallery** and methods for displaying all saved flags from the user's flag **gallery** ~~and searching up flags by name (i.e. input string)~~

Services: Displays all the saved flags from the user's flag **gallery** via an interactive **GUI**

Implemented By: Random Flag Generator

5.2.7 Help ~~HelpInstructions~~ Module (M10)

Secrets: Help and instructions information and methods for displaying the help and instructions menu

Services: Displays the helps and instructions menu and information via a **GUI**

Implemented By: Random Flag Generator

5.2.8 Settings Module (M11)

Secrets: Methods ~~Program version and methods~~ for displaying the settings menu, taking in user settings changes and updating settings

Services: Displays the settings menu ~~and program version~~ via an interactive **GUI**

Implemented By: Random Flag Generator

5.3 Software Decision Module

5.3.1 DecisionUtilities Module (M4)

Secrets: Auxiliary helper methods for padding generated hash digests (that are too short) and assisting in flag generation information parsing and usage in generating flags, and associated constants and values that will be used by the auxiliary helper methods

Services: Pads generated hash digests (that are too short) and assists in flag generation information parsing and usage in generating flags

Implemented By: Random Flag Generator

5.3.2 HashToFlag Module (M5)

Secrets: Methods for grinding generated hash digests to select the colours and flag design elements to generate flags

Services: Provides the selected colours and flag design elements obtained from grinding the generated hash digest to generate flags

Implemented By: Random Flag Generator

5.3.3 FlagGenerator Module (M6)

Secrets: Methods for obtaining the colours and flag design elements and generating the flags and saving the flag image files to the flag **gallery**

Services: Obtains the colours and flag design elements and generates the flags and saves the flag image files to the flag **gallery**

Implemented By: Random Flag Generator

6 Traceability Matrix

This section shows two traceability matrices: between the modules and the requirements and between the modules and the anticipated changes.

Req.	Modules
FR1	M7
FR2	M7
FR3	M7
FR4	M1, M2, M3, M4, M5, M6, M7
FR5	M8
FR6	M1, M2, M3, M4, M5, M6, M11
FR7	M6

AC7	M6
AC8	M1, M7
AC9	M10

Table 6: Trace Between Anticipated Changes and Modules

7 Use Hierarchy Between Modules

In this section, the uses hierarchy between modules is provided. Parnas (1978) said of two programs A and B that A *uses* B if correct execution of B may be necessary for A to complete

the task described in its specification. That is, A *uses* B if there exist situations in which the correct functioning of A depends upon the availability of a correct implementation of B. Figure 1 illustrates the use relation between the modules. It can be seen that the graph is a directed acyclic graph (DAG). Each level of the hierarchy offers a testable and usable subset of the system, and modules in the higher level of the hierarchy are essentially simpler because they use modules from the lower levels.

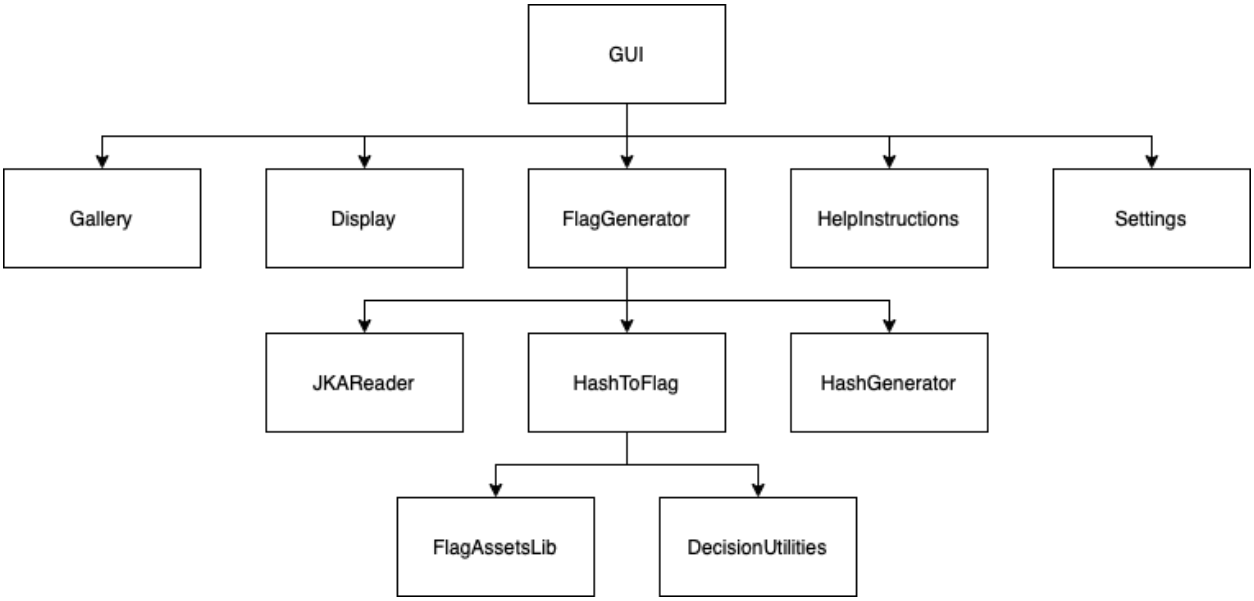

Figure 1: Use hierarchy among modules
