Table 1 Revision History

Date	Version	Notes
March 15, 2022	1.0	Initial Document
March 16, 2022	1.1	Added/updated doxygen commenting to HashGenerator.py, FlagGenerator.py and JKAResader.py modules
March 16, 2022	1.2	Added doxygen commenting to DecisionUtilites.py, FlagAssetsLib.py and HashToFlag.py modules
March 17, 2022	1.3	Added doxygen commenting to GUI.py, Settings.py, Display.py and Help.py modules
March 18, 2022	1.4	Updated doxygen commenting to various modules

Chapter 1

Hierarchical Index

1.1 Class Hierarchy

This inheritance list is sorted roughly, but not completely, alphabetically:

Frame	
GUI.GUI	7
GUI.StartPage	11
Settings.settings	11
tk.Tk	
GUI.SampleApp	9

Chapter 2

Class Index

2.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

GUI.GUI	Creates graphical user interface for random flag generator	7
GUI.SampleApp	Creates graphical user interface app for user to use the random flag generator	9
Settings.settings	Creates settings graphical user interface app for user to use the random flag generator	11
GUI.StartPage	Creates start page for random flag generator graphical user interface	11

Chapter 3

File Index

3.1 File List

Here is a list of all documented files with brief descriptions:

DecisionUtilities.py	
@title DecisionUtilities	15
Display.py	
@title Display	18
FlagAssetsLib.py	
@title FlagAssetsLib	19
FlagGenerator.py	
@title FlagGenerator	20
Gallery.py	
@title Gallery	21
GUI.py	
@title GUI	22
HashGenerator.py	
@title HashGenerator	23
HashToFlag.py	
@title HashToFlag	25
Help.py	
@title Help	28
JKARReader.py	
@title JKARReader	29
Settings.py	
@title Settings	30

Chapter 4

Class Documentation

4.1 GUI.GUI Class Reference

Creates graphical user interface for random flag generator.

Inheritance diagram for GUI.GUI:

Public Member Functions

- `def __init__(self, parent, controller)`
Creates the next page after clicking the start button from the [GUI](#) main page.
- `def init_window(self)`
Places the different widgets onto the second page after clicking on the start button on the [GUI](#) main page.
- `def generate(self, event)`
Generate the flag using the input text.

Public Attributes

- `controller`
- `image_text_input`
- `image2`
- `image3`
- `image4`
- `resize_image_text_input`
- `resize_image2`
- `resize_image3`
- `resize_image4`
- `photo_text_input`
- `photo2`

- `photo3`
- `photo4`
- `label`
- `button1`
- `button2`
- `button3`
- `input_box`
- `generate`

4.1.1 Detailed Description

Creates graphical user interface for random flag generator.

Graphical user interface user to use the software.

4.1.2 Constructor & Destructor Documentation

4.1.2.1 `__init__()`

```
def GUI.GUI.__init__ (
    self,
    parent,
    controller )
```

Creates the next page after clicking the start button from the [GUI](#) main page.

The [GUI](#) second page will have the text input box, generate button, display button, and a back button.

Parameters

<i>self</i>	Current object, common first parameter for any method of a class.
<i>parent</i>	A widget that acts as the parent of self, current object. All widgets in tkinter except the root window require a parent
<i>controller</i>	Other objects that are designed to act as a shared point, allowing several pages of widgets to interact. It decouples the different pages, making them independent. The controller decides what page will be visible.

4.1.3 Member Function Documentation

4.1.3.1 `generate()`

```
def GUI.GUI.generate (
    self,
    event )
```

Generate the flag using the input text.

The flag is generated with this function

Parameters

<i>self</i>	Current object, common first parameter for any method of a class.
<i>event</i>	When generate button is clicked, it will call this function to generate the flag.

4.1.3.2 init_window()

```
def GUI.GUI.init_window (
    self )
```

Places the different widgets onto the second page after clicking on the start button on the [GUI](#) main page.

The second page will include the text input input box, generate button, display button, and a back button.

The documentation for this class was generated from the following file:

- [GUI.py](#)

4.2 GUI.SampleApp Class Reference

Creates graphical user interface app for user to use the random flag generator.

Inheritance diagram for GUI.SampleApp:

Public Member Functions

- `def __init__(self, *args, **kwargs)`
Constructor for new app [GUI](#) object.
- `def show_frame(self, page_name)`
Shows the frame and switches between frames.

Public Attributes

- `frames`

4.2.1 Detailed Description

Creates graphical user interface app for user to use the random flag generator.

App for user to use the software.

4.2.2 Constructor & Destructor Documentation

4.2.2.1 `__init__()`

```
def GUI.SampleApp.__init__ (
    self,
    * args,
    ** kwargs )
```

Constructor for new app [GUI](#) object.

Creates object for [GUI](#)

Parameters

<i>self</i>	Current object, common first parameter for any method of a class.
<i>*args</i>	allows the function to accept an arbitrary number of arguments
<i>**kwargs</i>	allows the function to accept an arbitrary number of keyword arguments.

4.2.3 Member Function Documentation

4.2.3.1 `show_frame()`

```
def GUI.SampleApp.show_frame (
    self,
    page_name )
```

Shows the frame and switches between frames.

The frame is generated and switched.

Parameters

<i>self</i>	Current object, common first parameter for any method of a class.
<i>page_name</i>	Used to switch between frames in tkinter

The documentation for this class was generated from the following file:

- [GUI.py](#)

4.3 Settings.settings Class Reference

Creates settings graphical user interface app for user to use the random flag generator.

Public Member Functions

- `def set_flag_resolution ()`

4.3.1 Detailed Description

Creates settings graphical user interface app for user to use the random flag generator.

Settings graphical user interface for user to change the settings.

Sets flag resolution

The flag resolutions are determined, so the user needs to select the size they want

Returns

flag_resolution Selected flag resolution from the user, which the flag generator will use.

The documentation for this class was generated from the following file:

- [Settings.py](#)

4.4 GUI.StartPage Class Reference

Creates start page for random flag generator graphical user interface.

Inheritance diagram for GUI.StartPage:

Public Member Functions

- `def __init__ (self, parent, controller)`
Creates the start page for the [GUI](#) main page.
- `def init_window (self)`
Places the different widgets onto the start page for the [GUI](#) main page.

Public Attributes

- `controller`
- `image_app_logo`
- `image_start_button`
- `image_settings_button`
- `image_help_button`
- `resize_image_app_logo`
- `resize_image_start_button`
- `resize_image_settings_button`
- `resize_image_help_button`
- `photo_app_logo`
- `photo_start_button`
- `photo_settings_button`
- `photo_help_button`
- `app_logo`
- `start_button`
- `start_generate`
- `settings_button`
- `settings_generate`
- `help_button`
- `help_generate`

4.4.1 Detailed Description

Creates start page for random flag generator graphical user interface.

Start page for user to use the software.

4.4.2 Constructor & Destructor Documentation

4.4.2.1 `__init__()`

```
def GUI.StartPage.__init__ (
    self,
    parent,
    controller )
```

Creates the start page for the [GUI](#) main page.

The start page will have the logo, start button, settings button, and a help button.

Parameters

<i>self</i>	Current object, common first parameter for any method of a class.
<i>parent</i>	A widget that acts as the parent of self, current object. All widgets in tkinter except the root window require a parent
<i>controller</i>	Other objects that are designed to act as a shared point, allowing several pages of widgets to interact. It decouples the different pages, making them independent. The controller decides what page will be visible.

4.4.3 Member Function Documentation

4.4.3.1 `init_window()`

```
def GUI.StartPage.init_window (
    self )
```

Places the different widgets onto the start page for the [GUI](#) main page.

The start page will include the logo, start button, settings button, and a help button.

The documentation for this class was generated from the following file:

- [GUI.py](#)

Chapter 5

File Documentation

5.1 DecisionUtilities.py File Reference

@title DecisionUtilities

Functions

- def [DecisionUtilities.pad_hashcode](#) (hashcode)
Generates a padded hashcode if it is not the minimum required length.
- def [DecisionUtilities.choose_from_list](#) (source_list, index)
Generates a selection from an array.
- def [DecisionUtilities.map_decision](#) (max_digitsum, num_decisions, digitsum)
Maps a number to an index of an array.
- def [DecisionUtilities.split_sequence](#) (seq, n)
Generates a list of shorter tokens from a given input string.
- def [DecisionUtilities.hex2rgb](#) (hexvalue)
Generates a tuple of an RGB colour from a hexadecimal number.
- def [DecisionUtilities.diff](#) (a, b)
Calculates the absolute difference of two float values.

Variables

- int **DecisionUtilities.COLOR_QUANTITY** = 5
Number of colours to be generated for flag design options.
- int **DecisionUtilities.HEX_COLOR_LEN** = 6
Length of a color in hex.
- int **DecisionUtilities.HEX_BASE** = 16
Base of the hexadecimal number system.
- def **DecisionUtilities.MINIMUM_HASH_LEN** = COLOR_QUANTITY * HEX_COLOR_LEN
To generate unique colors, hashes need to contain at least this many characters.
- int **DecisionUtilities.ASPECT_CONTROL_LEN** = 6
Length of hash characters to generate one option.
- int **DecisionUtilities.MAX_DECISION_VALUE** = 16777215
Decimal representation of hexadecimal 'ffffff' as the maximum value for aspect decisions.
- bool **DecisionUtilities.DEBUG** = False
Set True to generate debug output in this module.

5.1.1 Detailed Description

@title DecisionUtilities

A collection of modules used by HashToFlag to grind the hashcode and map decisions to arrays.

Author

Akram Hannoufa

Date

2022-03-15

5.1.2 Function Documentation

5.1.2.1 choose_from_list()

```
def DecisionUtilities.choose_from_list (
    source_list,
    index )
```

Generates a selection from an array.

Parameters

<i>source_list</i>	the list to make a selection from
<i>index</i>	the index to take the selection.

Returns

choice, the option from the *source_list* that matches the index.

5.1.2.2 diff()

```
def DecisionUtilities.diff (
    a,
    b )
```

Calculates the absolute difference of two float values.

Parameters

<i>a</i>	first float value
<i>b</i>	second float value

Returns

The integer value of the absolute difference between float values.

5.1.2.3 hex2rgb()

```
def DecisionUtilities.hex2rgb (
    hexvalue )
```

Generates a tuple of an RGB colour from a hexadecimal number.

hexvalue is length 6, with every 2 characters being part of the RGB tuple

Parameters

<i>hexvalue</i>	hexadecimal value (length=6) to convert to RGB
-----------------	--

Returns

RGB tuple, representing an RGB colour in integer values

5.1.2.4 map_decision()

```
def DecisionUtilities.map_decision (
    max_digitsum,
    num_decisions,
    digitsum )
```

Maps a number to an index of an array.

Parameters

<i>max_digitsum</i>	the maximum possible option
<i>num_decisions</i>	the number of possible decisions
<i>digitsum</i>	the digit to map within possible options

Returns

decision, index of array to get decision from.

5.1.2.5 pad_hashcode()

```
def DecisionUtilities.pad_hashcode (
    hashcode )
```

Generates a padded hashcode if it is not the minimum required length.

Input string gets padded until it is long enough to generate all required flag options.

Parameters

<i>hashcode</i>	a string of the input string's corresponding hashcode value.
-----------------	--

Returns

modified hashcode, a padded version of the input hashcode.

5.1.2.6 `split_sequence()`

```
def DecisionUtilities.split_sequence (
    seq,
    n )
```

Generates a list of shorter tokens from a given input string.

Created strings are of a specified size, n

Parameters

<i>seq</i>	input string to break apart
<i>n</i>	length of generated substrings

Returns

tokens, list of shorter substrings of length n

5.2 Display.py File Reference

@title Display

Functions

- def `Display.display_flag` (input_string)
Displays the flag image file for the given input string and.

5.2.1 Detailed Description

@title Display

A display of the generated flag

Author

Ganghoon Park

Date

2022-03-17

5.2.2 Function Documentation**5.2.2.1 display_flag()**

```
def Display.display_flag (
    input_string )
```

Displays the flag image file for the given input string and.

Generated flag gets displayed on the screen.

Parameters

<i>input_string</i>	The given input string for the generated flag. This is also the flag of the flag file.
---------------------	--

5.3 FlagAssetsLib.py File Reference

@title FlagAssetsLib

Variables

- list **FlagAssetsLib.STRIPE_STYLE** = ['HORIZONTAL', 'VERTICAL', 'NONE']
Possible stripe styles a flag can have.
- list **FlagAssetsLib.STRIPE_NUMBER** = ['ZERO', 'TWO', 'THREE', 'SIX', 'TWELVE']
Possible number of stripes a flag can have.
- list **FlagAssetsLib.SYMBOL_LOCATION** = ['TOP_LEFT', 'CENTER', 'TOP_RIGHT']
Possible locations a symbol can be placed on a flag.
- list **FlagAssetsLib.SYMBOL_NUMBER** = ['ZERO', 'ONE', 'TWO']
Possible number of symbols a flag can have.
- list **FlagAssetsLib.SYMBOL_TYPES** = ['MOON', 'ROUNDEL', 'SWORD', 'CROSS', 'SALTIRE']
- dictionary **FlagAssetsLib.flag_assets** = {"SALTIRE": "jka/saltire.jka", "CROSS": "jka/cross.jka", "MOON": "jka/moon.jka", "SWORD": "jka/sword.jka", "ROUNDEL": "jka/roundel.jka"}
Loads in all flag assets.

5.3.1 Detailed Description

@title FlagAssetsLib

A library of constants and symbol/design options

Author

Akram Hannoufa

Date

2022-03-15

5.3.2 Variable Documentation

5.3.2.1 STRIPE_NUMBER

```
FlagAssetsLib.STRIPE_NUMBER = ['ZERO', 'TWO', 'THREE', 'SIX', 'TWELVE']
```

Possible number of stripes a flag can have.

Possible symbol types.

5.4 FlagGenerator.py File Reference

@title FlagGenerator

Functions

- def [FlagGenerator.generate_flag](#) (hash_input, hash_type)
generates the flag image file using the given hash input string and input hash type string
- def [FlagGenerator.generate_flag_data](#) (hash_input, hash_type)
generates the flag data using the given hash input string and input hash type string

5.4.1 Detailed Description

@title FlagGenerator

A library module for generating the flag using a given input string and hashing algorithm

FlagGenerator module, uses HashGenerator, HashToFlag and JKARReader modules; no exported constants or types, no state or environment variables, no state invariant or assumptions

Author

Nathaniel Hu

Date

2022-03-18

5.4.2 Function Documentation

5.4.2.1 generate_flag()

```
def FlagGenerator.generate_flag (
    hash_input,
    hash_type )
```

generates the flag image file using the given hash input string and input hash type string

uses functions to get the flag data from the hash input string and input hash type string, and stacks the flag asset layers to generate the final flag image saved to the gallery

Parameters

<i>hash_input</i>	a string that will be run through the given hashing algorithm to get a hexadecimal hashing digest
<i>hash_type</i>	a string representing the selected hashing algorithm

5.4.2.2 generate_flag_data()

```
def FlagGenerator.generate_flag_data (
    hash_input,
    hash_type )
```

generates the flag data using the given hash input string and input hash type string

uses external functions to generate the flag data from the hash input string and input hash type string

Parameters

<i>hash_input</i>	a string that will be run through the given hashing algorithm to get a hexadecimal hashing digest
<i>hash_type</i>	a string representing the selected hashing algorithm

Returns

tuple containing the generated flag data consisting of the list of five colours, the stripe info and symbol info

5.5 Gallery.py File Reference

@title Gallery

Functions

- def [Gallery.gallery](#) ()
Display a gallery of previously generate flags.

5.5.1 Detailed Description

@title Gallery

A gallery of the previously generated flags

Author

Ganghoon Park

Date

2022-03-17

5.5.2 Function Documentation

5.5.2.1 gallery()

```
def Gallery.gallery ( )
```

Display a gallery of previously generate flags.

The gallery will display the generated flags and have an option to go back to the main GUI screen.

5.6 GUI.py File Reference

@title GUI

Classes

- class [GUI.SampleApp](#)
Creates graphical user interface app for user to use the random flag generator.
- class [GUI.StartPage](#)
Creates start page for random flag generator graphical user interface.
- class [GUI.GUI](#)
Creates graphical user interface for random flag generator.

Variables

- `GUI.app = SampleApp()`

5.6.1 Detailed Description

@title GUI

A graphical user interface module uses all other modules to allow the user to communicate with the Random Flag Generator software

Author

Ganghoon Park

Date

2022-03-17

5.7 HashGenerator.py File Reference

@title HashGenerator

Functions

- def [HashGenerator._get_hash_algo](#) (hash_type)
gets the hashing algorithm from the dictionary of available hashing algorithms using the given input hash type string
- def [HashGenerator._get_hash_hex](#) (hash_input, hash_algo)
gets the hexadecimal representation of the hashing digest using the given input string and hashing algorithm
- def [HashGenerator.hash_generator](#) (hash_input, hash_type='sha256')
generates a hashing digest using the given input string and hashing algorithm

5.7.1 Detailed Description

@title HashGenerator

A library module for getting the hexadecimal hash of a given string

HashGenerator module, uses no other modules; no exported constants or types, no state or environment variables, no state invariant or assumptions

Author

Nathaniel Hu

Date

2022-03-18

5.7.2 Function Documentation

5.7.2.1 _get_hash_algo()

```
def HashGenerator._get_hash_algo (
    hash_type ) [private]
```

gets the hashing algorithm from the dictionary of available hashing algorithms using the given input hash type string
the default hashing algorithm, SHA-256, is used if the input hash type is not in the dictionary of available hashing algorithms

Parameters

<i>hash_type</i>	a string representing the selected hashing algorithm
------------------	--

Returns

selected hashing algorithm if found; otherwise SHA-256 hashing algorithm returned

5.7.2.2 `_get_hash_hex()`

```
def HashGenerator._get_hash_hex (
    hash_input,
    hash_algo ) [private]
```

gets the hexadecimal representation of the hashing digest using the given input string and hashing algorithm

the byte encoding will be specified per the Python version used

Parameters

<i>hash_input</i>	a string that will be run through the given hashing algorithm to get a hexadecimal hashing digest
<i>hash_algo</i>	a hashing algorithm that will be used to turn the input string into a hexadecimal hashing digest

Returns

hexadecimal hashing digest obtained from the given input string using the given hashing algorithm

5.7.2.3 `hash_generator()`

```
def HashGenerator.hash_generator (
    hash_input,
    hash_type = 'sha256' )
```

generates a hashing digest using the given input string and hashing algorithm

the hashing algorithm SHA-256 will be used by default if none is specified

Parameters

<i>hash_input</i>	a string that will be run through the given hashing algorithm to get a hexadecimal hashing digest
<i>hash_type</i>	a string representing the selected hashing algorithm

Returns

hexadecimal hashing digest obtained from the given input string using the given hashing algorithm

5.8 HashToFlag.py File Reference

@title HashToFlag

Functions

- def `HashToFlag.grind_hash_for_colors` (hashcode)
Generates the array of colours to be used in the flag generation.
- def `HashToFlag.grind_hash_for_stripe_style` (hashcode)
Generates the stripe style to be used in flag generation.
- def `HashToFlag.grind_hash_for_stripe_number` (hashcode)
Generates the number of stripes to be used in flag generation.
- def `HashToFlag.grind_hash_for_symbol_locations` (hashcode)
Generates the symbol location to be used in flag generation.
- def `HashToFlag.grind_hash_for_symbol_number` (hashcode)
Generates the number of symbols to be used in flag generation.
- def `HashToFlag.grind_hash_for_symbol_types` (hashcode)
Generates the symbol type to be used in flag generation.

5.8.1 Detailed Description

@title HashToFlag

A module with functions for taking a given hashcode input and generating the options for the flag to be generated.

Uses DecisionsUtilities and FlagAssetsLib

Author

Akram Hannoufa

Date

2022-03-15

5.8.2 Function Documentation

5.8.2.1 grind_hash_for_colors()

```
def HashToFlag.grind_hash_for_colors (
    hashcode )
```

Generates the array of colours to be used in the flag generation.

Hex values of the hashcode are converted to an RGB value for colour.

Parameters

<i>hashcode</i>	a string of the input string's corresponding hashcode value.
-----------------	--

Returns

colors, an array of RGB values to be used by FlagGenerator.

5.8.2.2 grind_hash_for_stripe_number()

```
def HashToFlag.grind_hash_for_stripe_number (  
    hashcode )
```

Generates the number of stripes to be used in flag generation.

Uses the second 6 characters of a hashcode to map to an array index, ie. the option to use for the desired aspect.

Parameters

<i>hashcode</i>	a string of the input string's corresponding hashcode value.
-----------------	--

Returns

A stripe number option.

5.8.2.3 grind_hash_for_stripe_style()

```
def HashToFlag.grind_hash_for_stripe_style (  
    hashcode )
```

Generates the stripe style to be used in flag generation.

Uses the first 6 characters of a hashcode to map to an array index, ie. the option to use for the desired aspect.

Parameters

<i>hashcode</i>	a string of the input string's corresponding hashcode value.
-----------------	--

Returns

A stripe style option.

5.8.2.4 grind_hash_for_symbol_locations()

```
def HashToFlag.grind_hash_for_symbol_locations (
    hashcode )
```

Generates the symbol location to be used in flag generation.

Uses the third 6 characters of a hashcode to map to an array index, ie. the option to use for the desired aspect.

Parameters

<i>hashcode</i>	a string of the input string's corresponding hashcode value.
-----------------	--

Returns

A symbol location option.

5.8.2.5 grind_hash_for_symbol_number()

```
def HashToFlag.grind_hash_for_symbol_number (
    hashcode )
```

Generates the number of symbols to be used in flag generation.

Uses the fourth 6 characters of a hashcode to map to an array index, ie. the option to use for the desired aspect.

Parameters

<i>hashcode</i>	a string of the input string's corresponding hashcode value.
-----------------	--

Returns

A symbol number option.

5.8.2.6 grind_hash_for_symbol_types()

```
def HashToFlag.grind_hash_for_symbol_types (
    hashcode )
```

Generates the symbol type to be used in flag generation.

Uses the fifth 6 characters of a hashcode to map to an array index, ie. the option to use for the desired aspect.

Parameters

<i>hashcode</i>	a string of the input string's corresponding hashcode value.
-----------------	--

Returns

A symbol type option.

5.9 Help.py File Reference

@title Help

Functions

- `def Help.help_menu ()`
Shows the help menu to teach the user how to use the software and how it works.

5.9.1 Detailed Description

@title Help

A help option teach the user how to use the software and giving more information of it.

Author

Ganghoon Park

Date

2022-03-17

5.9.2 Function Documentation

5.9.2.1 help_menu()

```
def Help.help_menu ( )
```

Shows the help menu to teach the user how to use the software and how it works.

The help menu will have instructions and a button to go back to the main GUI screen.

5.10 JKARReader.py File Reference

@title JKARReader

Functions

- def `JKARReader.parse_jka_file` (filename)
parses the input flag asset (.jka) file data into a pixel map

Variables

- string `JKARReader.FILLED_PIXEL` = "#"
exported type representing a filled pixel for a flag asset
- string `JKARReader.UNFILLED_PIXEL` = "."
exported type representing an unfilled pixel for a flag asset

5.10.1 Detailed Description

@title JKARReader

A library module for parsing .jka files for use in generating flags

JKARReader module, uses no other modules; exported constants FILLED_PIXEL and UNFILLED_PIXEL, no exported types, no state or environment variables, no state invariant, assumption that input .jka file exists in the flag assets directory

Author

Nathaniel Hu

Date

2022-03-18

5.10.2 Function Documentation

5.10.2.1 `parse_jka_file()`

```
def JKARReader.parse_jka_file (  
    filename )
```

parses the input flag asset (.jka) file data into a pixel map

parses the file data by pixel and adds filled pixels to the pixel map

Parameters

<i>filename</i>	a string representing the name of the flag asset (.jka) file that contains the flag asset pixel map data
-----------------	--

Returns

a list containing the (x, y) coordinates of all filled pixels for the given flag asset

5.11 Settings.py File Reference

@title Settings

Classes

- class [Settings.settings](#)
Creates settings graphical user interface app for user to use the random flag generator.

Functions

- def [Settings.set_hash_type](#) ()
Sets the hash type.
- def [Settings.set_flag_colour](#) ()
Sets flag colour.
- def [Settings.set_flag_symbol](#) ()
Sets flag symbol.

5.11.1 Detailed Description

@title Settings

A settings option to select differnt flag size, set certain features, such as colour, symbols, stripes, and select different hash type

Author

Ganghoon Park

Date

2022-03-17

5.11.2 Function Documentation

5.11.2.1 set_flag_colour()

```
def Settings.set_flag_colour ( )
```

Sets flag colour.

The flag colour are determined, so the user needs to select the colour they want

Returns

flag_colour Selected flag colour from the user, which the flag generator will use.

5.11.2.2 set_flag_symbol()

```
def Settings.set_flag_symbol ( )
```

Sets flag symbol.

The flag symbols are determined by the jka files, so the user needs to select the symbol they want

Returns

flag_symbol Selected flag symbol from the user, which the flag generator will use.

5.11.2.3 set_hash_type()

```
def Settings.set_hash_type ( )
```

Sets the hash type.

The flag generator will use the selected hash type

Returns

hash_type Selected hash type from the user, which flag generator will use.
